

**METHOD AND SYSTEM FOR PROVIDING
A WORK-AT-HOME TELECOMMUNICATION SERVICE**

Abstract of the Disclosure

5 A work-at-home telecommunication service is provided in
response to receiving, from a calling party, a service-specific vertical feature
code and a dialed number to initiate a call. The call is suspended and a query
is sent to a service control point after receiving the vertical feature code and the
10 dialed number. The query includes the dialed number and a calling party
identification number. A response to the query is formed using the service
control point by translating the dialed number to a called party identification
number, and by modifying the calling party identification number to an
15 identification number of a group associated with the calling party. The response
includes the called party identification number, the calling party identification
number, and a carrier identification code which identifies a telecommunication
carrier for the group associated with the calling party. The call is routed to the
called party using the telecommunication carrier identified by the carrier
20 identification code. A distinctive ring can be provided at the called party to
indicate that the call is associated with the work-at-home telecommunication
service.
